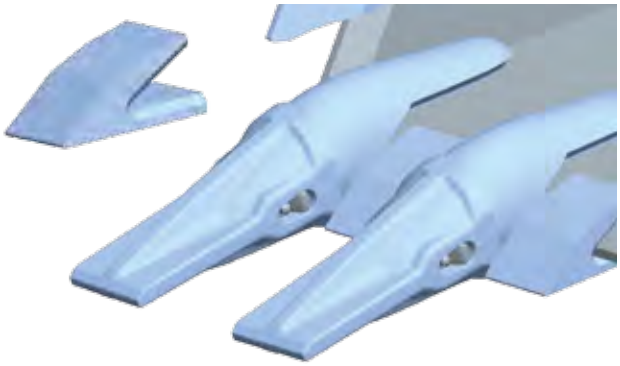
WEAR PROTECTION

LIP SHROUDS

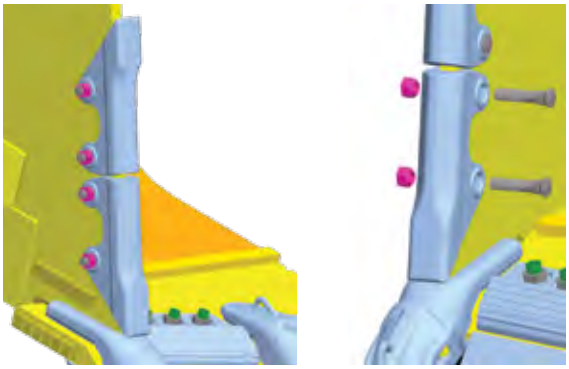
Protecting the leading edge of the bucket from being exposed to constant abrasive wear prolongs bucket life and protects your investment. Hensley has a wide range of universal lip shrouds available in weld-on and J-bolt styles for virtually any machine.

- Extra material in high wear areas
- Sharp contour for better penetration
- Versatility to fit several different bucket widths



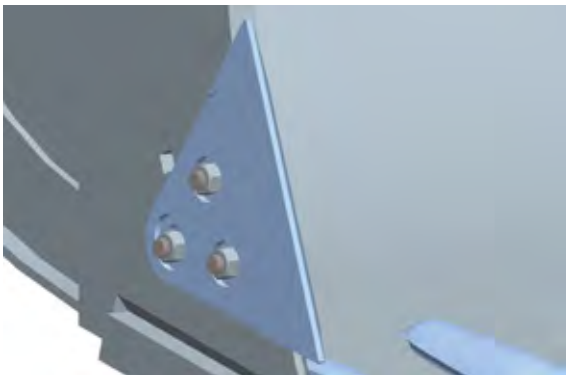
VERTICAL SHROUDS

Hensley vertical shrouds protect the cutting sides of the bucket with highly wear-resistant material. Available in six different sizes, they're simple to install and quick and easy to replace.



SIDECUTTERS

Hensley sidecutters are designed to protect buckets and improve productivity. Standard bolt-on sidecutters cut clearance for the bucket and expand bucket capacity. Strike-off sidecutters protect the bucket cheek plates without cutting additional clearance. Beyond Hensley's proprietary products, direct replacements are available for Caterpillar and Esco-style buckets including extension plates.



SEGMENTS AND TOP COVERS

Hensley has a full line available, which consists of both rolled and cast steel versions of loaders lip protection for the major loader manufacturers. The combination of bottom and top lip protections is provided by both segments and top covers.

LIP SHROUDS FOR LHD SCOOP TRAM BUCKETS
Specialized Wear Protection

CAST ALLOY LIP SHROUDS FOR LHD SCOOP TRAM BUCKETS - WELDING

NOTE: Read all instructions carefully before welding.

The material of the cast lip assembly is Hensley alloy #3, which has been heat-treated to a hardness of approximately 477 Brinell. The alloy is a chrome/moly steel with approximately 0.28% carbon. The material is weldable if the proper precautions are followed.

Recommendations:

- Use E7018 low hydrogen rod or E70 wire. Be sure the welding materials are free of moisture.
- Preheat to 350˚ - 500˚ F (175˚ - 257˚ C).
- Interpass temperature should not exceed 500o F (260˚ C).
- Start at the center of the blade and weld toward the edges of the bucket.
- Use 2" (51mm) minimum tack welds on both sides.
- Weld both sides alternately between passes.
- Remove all slag subsequent to weld passes.
- Post-heat the entire assembly uniformly to 350˚ - 400˚ F (176˚ - 204˚C) and cover with a thermal blanket. This serves as stress relief and to temper any martensite that may have formed during cooling from the weld. This is important as the steel contains a significant amount of alloy.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Loaders, Excavators & Face Shovels

Typical Shroud Assembly With Hardware
(Loader lip shroud shown for illustrative purposes only.
Not all assemblies use all hardware shown.)

IMPORTANT NOTE: READ ALL OF THE INSTRUCTIONS COMPLETELY PRIOR TO ASSEMBLY

STEP 1- NEW INSTALLATION

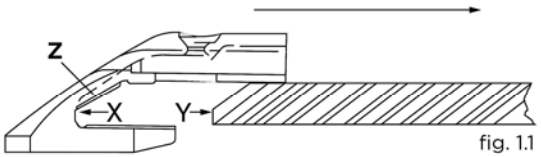

fig. 1.1

Position the shroud on the lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the lip "Y". There should be **no** contact between the bevel of the lip and area "Z" of the shroud (fig. 1.1).
NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

STEP 1- REPLACEMENT INSTALLATION

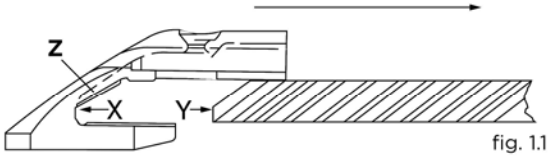

fig. 1.1

Grind the top surface of the lip material that will be affected by weld. Insure all carbon slag or other impurites from the removal of the old base are ground out. The use of non-destructive testing at this point will help determine if there are any cracks present in the base material. Repair base material as needed. (Now proceed as with new installation.)

Position the shroud on the lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the lip "Y". There should be **no** contact between the bevel of the lip and area "Z" of the shroud (fig. 1.1). **NOTE:** This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Loaders, Excavators & Face Shovels

STEP 2

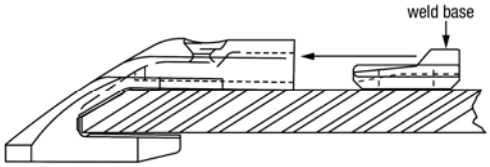

fig. 2.1

Slide the weld base from the rear into the receiving slots of the shroud (fig. 2.1)

STEP 3

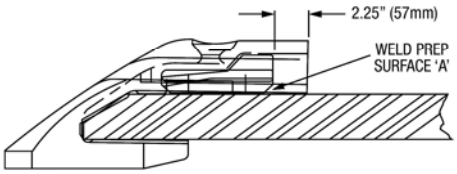

fig. 3.1

Position the weld base according to the chart below (a deviation of 33/32" (2.5 mm) is allowable).

WELD BASE PLACEMENT (33/32" (2.5mm) allowable)		
BASE	INCHES	MM
LSWB3	2-1/4"	(57)
LSWB6	3-1/2"	(89)
LSWB8	2-1/4"	(57)

After placement has been confirmed, preheat the base material to 300°F/147°C and tack weld the base at the rear along weld prep surface "A" (fig.3.1).

STEP 4

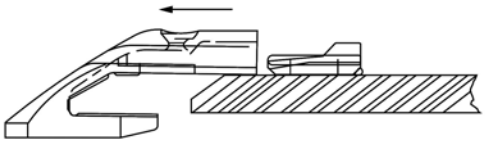

fig. 4.1

Remove the shroud and prepare to weld-out the base by re-establishing the preheat temperature of 300°F/147°C for the base material (fig4.1). Maintain this temperature throughout the welding process.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Loaders, Excavators & Face Shovels

SPECIAL NOTES

Recommended filler material: AWS specification A5.1, class E7018, stick electrode. Stick electrodes should be kept in a heated rod oven at 250°/120°C prior to use.

NOTE: See manufacturers recommended procedures for storage and preservation of low hydrogen electrodes.

Recommended weld types: Stringer beads are recommended for higher strength and less distortion. The use of weave or wash beads is **NOT** recommended and should not be used. Arc strikes should be avoided or ground down.

STEP 5

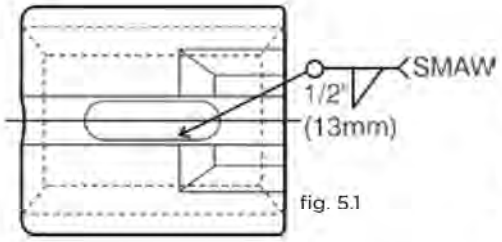

fig. 5.1

Weld-out for the base should begin with the slot weld. A 1/2"(13mm) fillet weld should be deposited in this area (fig. 5.1).

BE SURE THAT THE ENTIRE BOTTOM SURFACE OF THE WELD BASE MAINTAINS CONTACT WITH THE LIP DURING ENTIRE WELD-OUT PROCESS.

STEP 6

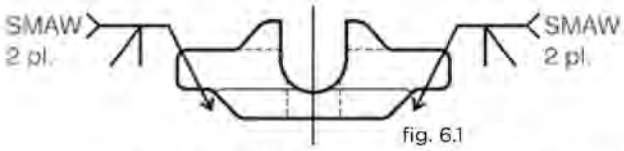

fig. 6.1

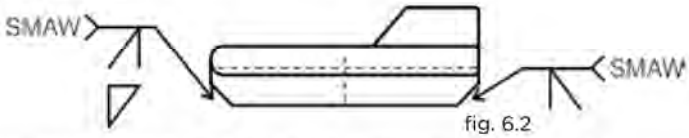

fig. 6.2

Apply weld to the base perimeter next. Utilizing groove welds, fill the 1/2"(13mm) weld groove on the base completely (fig. 6.1 & fig. 6.2). Care must be taken at this point not to add too much weld. If joint is over welded, the weld material can interfere with the lip shroud. The idea is to add as much weld as possible to the base without causing interference with the lip shroud (fig. 6.3 & fig. 6.4)

When the welding process has been completed, allow a slow cool down period to ambient temperature. A cool down rate of no greater than 35°F/2°C per hour is recommended.

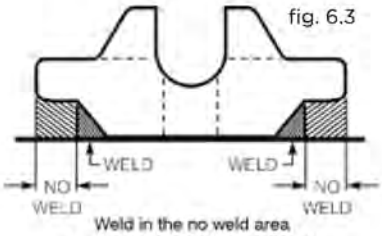

fig. 6.3

Weld in the no weld area can interfere with the lip shroud.

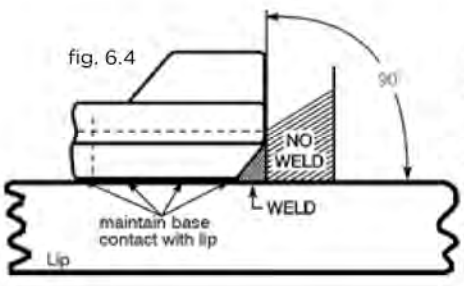

fig. 6.4

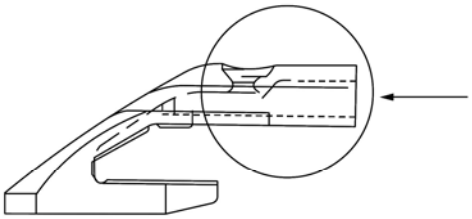
Weld in this area will interfere with the front washer of the J-Bolt assembly which must fit flush against the rear of the weld base.

Ensure contact with lip on entire length of weld base bottom surface as indicated.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Loaders, Excavators & Face Shovels

STEP 7



Area of detail for figures 7.1 - 7.3

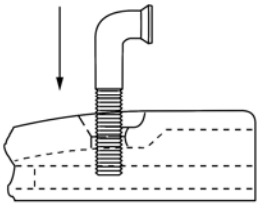


fig. 7.1

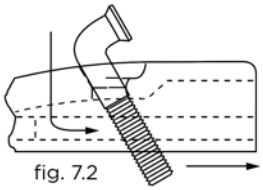

fig. 7.2

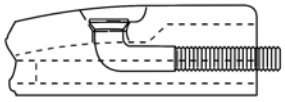

fig. 7.3

Before repositioning the shroud on the lip, insert the J-bolt into the shroud through the top hole (fig. 7.1). Rotate the bolt 90° so that the threaded end is facing the rear of the shroud (figs. 7.2 - 7.3).

STEP 8

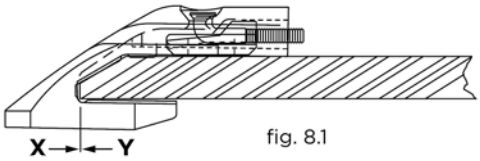

fig. 8.1

Reposition the shroud on the lip by sliding it onto the weld base as far as it will go, once again, making sure surface "X"contacts surface "Y"(fig. 8.1).

STEP 9 (J4 J-bolt assemblies)

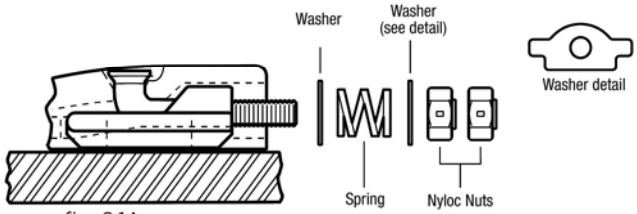

fig. 9.1A

Attach the washers, the spring and the nuts in the order indicated for J-bolt assembly type J4. (fig. 9.1A),

[**NOTE: the locking nut cannot be hand-threaded onto the J-bolt**]
then torque to specifications listed. (fig. 9.2).

STEP 9 (J6 J-bolt assemblies)

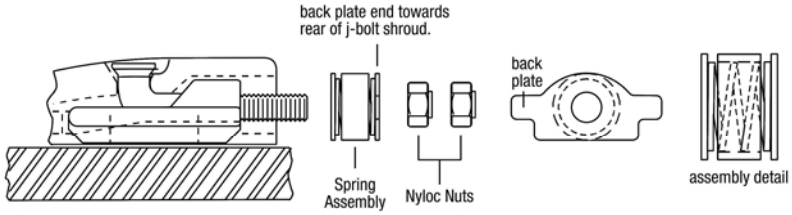

fig. 9.1B **NOTE:** Above assembly is show for illustrative purposes only. Not all assemblies utlilize all parts shown.

Attach the washers, the spring and the nuts in the order indicated for J-bolt assembly type J6. (fig. 9.1B), then torque to specifications listed. (fig. 9.2).

STEP 9 (J2 J-bolt assemblies used with optional cap)

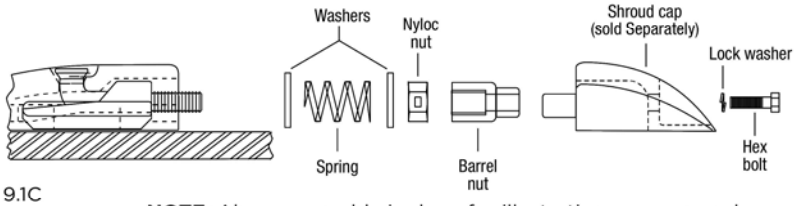

fig. 9.1C

NOTE: Above assembly is show for illustrative purposes only. Not all assemblies utlilize all parts shown.

Attach the washers, the spring and the nuts in the order indicated for J-bolt assembly type J2. (fig. 9.1C), then torque to specifications listed. (fig. 9.2). Finish assembly by installing cap (if part of assembly) with lock washer and cap bolt.

J-Bolt Assembly Torque Recommendations

J-BOLT ASSEMBLY	LOCKING NUT MAX TORQUE		GRADE 8 BOLT MAX TORQUE	
	ft-lbs	Nm	ft-lbs	Nm
SFA34J2	175	237	NA	NA
SFA34J4	175	237	NA	NA
SFA1J2	200	271	NA	NA
SFA1J4	200	271	NA	NA
SFA125J2	225	305	NA	NA
SFA125J6	225	305	NA	NA

fig. 9.2

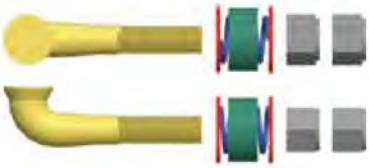
SPECIAL NOTE

For best results, it may be necessary to re-torque all fastener components periodically depending on the application. Usually, re-torquing components after a few hours of machine operation will insure component security.

J -BOLT INSTALLATION AND WELDING

Lip Shrouds for Hensley Cast Lips for Face Shovels

J-bolt Assembly



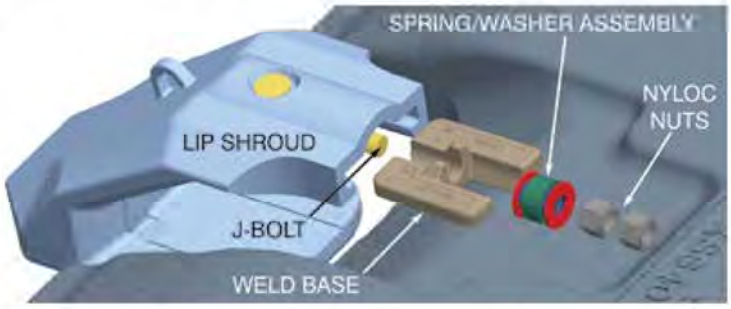
SFA150J6

Weld Base

LSWB9

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Hensley Cast Lips for Face Shovels

BEFORE STARTING INSTALLATION, BE SURE TO READ ALL INSTRUCTIONS THOROUGHLY!



STEP 1

NEW INSTALLATION

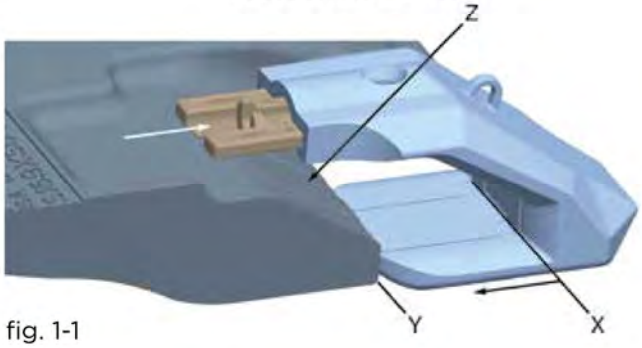


fig. 1-1

1 a) Slide weld base into back of lip shroud.
1 b) Position the shroud on the cast lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the lip "Y". There should be no contact between the bevel of the shroud and area "Z" of the cast lip (fig. 1-1).

NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

REPLACEMENT INSTALLATION

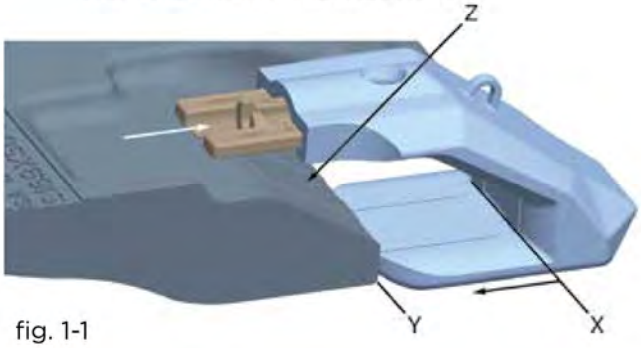

fig. 1-1

Grind the top surface of the lip material that will be affected by weld. Insure all carbon slag or other impurities from the removal of the old base are ground out. The use of non-destructive testing at this point will help determine if there are any cracks present in the base material. Repair base material as needed. (Now proceed as with new installation.)

1 a) Slide weld base into back of lip shroud.
1 b) Position the shroud on the cast lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the lip "Y". There should be **no** contact between the bevel of the shroud and area "Z" of the cast lip (fig. 1-1).

NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Hensley Cast Lips for Face Shovels

STEP 2

fig. 2-1

Align the back of the Weld base so that it is flush with the back of shroud (fig. 2-1).

STEP 3

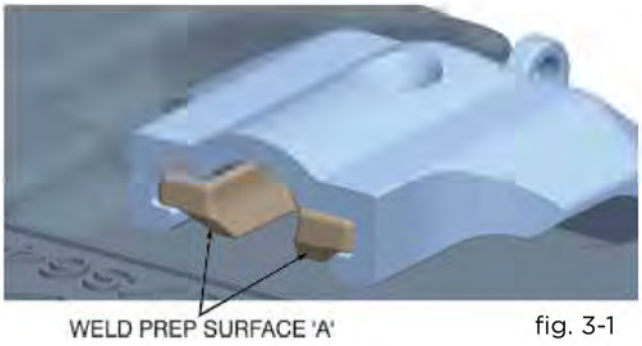

fig. 3-1

After placement of weld base has been confirmed, establish a preheat temperature of 300˚F / 150˚C to 450˚F / 230˚C for the base material. Tack weld the base at the rear along weld prep surface “A" (fig.3-1).

SPECIAL NOTES

Recommended filler material: AWS specification A5.1, class E7018 stick electrode. Stick electrodes should be kept in a heated rod oven at 250°F / 120°C prior to use.

NOTE: See manufacturer’s recommended procedures for storage and preservation of low hydrodgen electrodes.

Recommended weld types: Stringer beads are recommended for higher strength and less distortion.The use of weave or wash beads in **NOT** recommended and should not be used. Arc strikes should be avoided or ground down.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Hensley Cast Lips for Face Shovels

STEP 4

Remove the shroud and prepare to weld-out the base by re-establishing the preheat temperature of 300˚F / 150˚C to 450˚F / 230˚C for the base material (fig. 4-1). Maintain this temperature throughout the welding process.

fig. 4-1

STEP 5

Weld-out for the base should begin with the inner legs of base. A 1/2" (13mm) fillet weld should be deposited in this area (fig. 5-1).

BE SURE THAT THE ENTIRE BOTTOM SURFACE OF THE WELD BASE MAINTAINS CONTACT WITH THE LIP DURING ENTIRE WELD-OUT PROCESS.

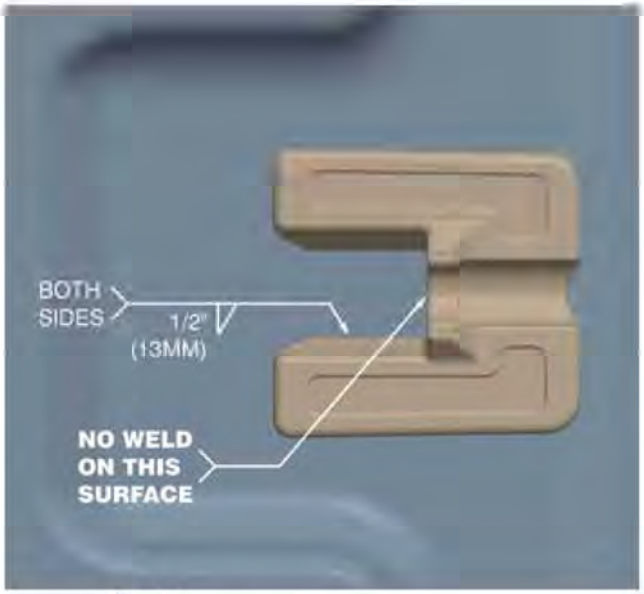

fig. 5-1

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Hensley Cast Lips for Face Shovels

STEP 6

fig. 6-1

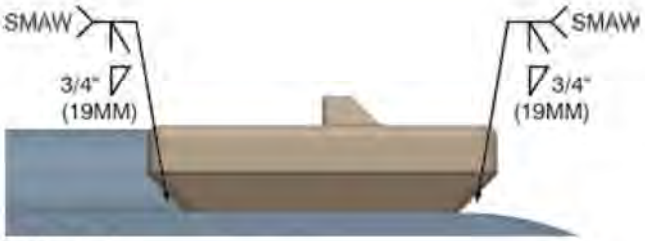

fig. 6-2

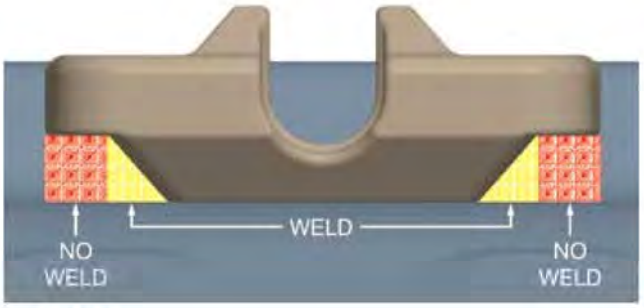

fig. 6-3

Apply weld to the base perimeter next. Utilizing groove welds, fill the 1.0" (25mm) weld groove on the base completely (fig. 6-1 & fig. 6-2). Care must be taken at this point not to add too much weld. If joint is over welded, the weld material can interfere with the lip shroud. The idea is to add as much weld as possible to the base without causing interference with the lip shroud (fig. 6-3). When the welding process has been completed, allow a slow cool down period to ambient temperature. A cool down rate of no greater than 450˚F / 250˚C per hour is recommended.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Hensley Cast Lips for Face Shovels

STEP 7

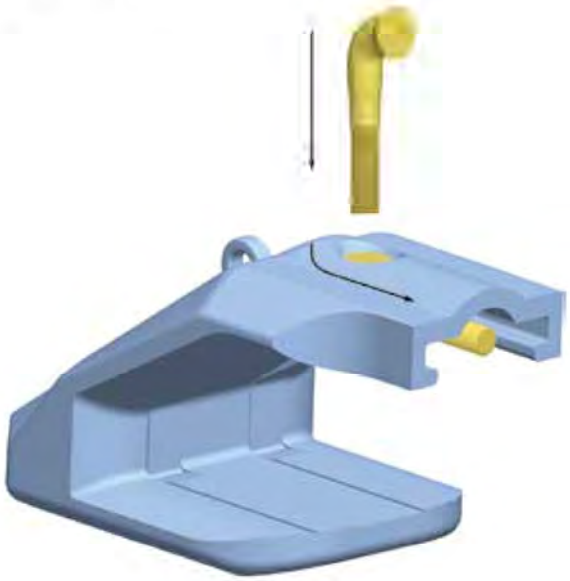

fig. 7-1

Before repositioning the shroud on the lip, insert the J-bolt into the shroud through the top hole
(fig. 7-1). Rotate the bolt 90o so that the threaded end is facing the rear of the shroud.

STEP 8

Reposition the shroud on the lip by sliding it onto the weld base as far as it will go, once again, making sure surface "X" contacts surface "Y" (fig. 8-1).

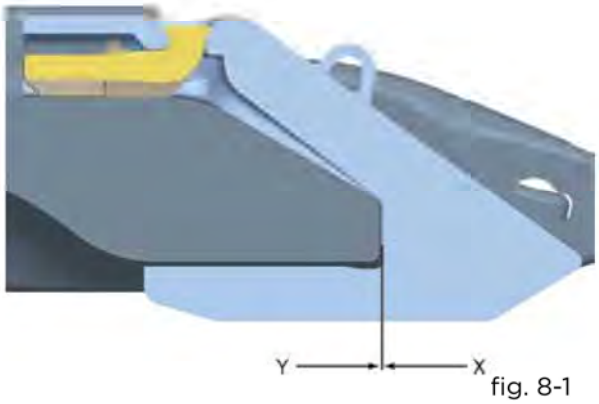

fig. 8-1

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Hensley Cast Lips for Face Shovels

STEP 9

Install the washer, spring collar assembly and the nuts in the order indicated for J-bolt assembly type J6 (fig. 9-1), Torque locking nuts to 300 ft. lbs / 407 Nm.

[**NOTE: the locking nut cannot be hand-threaded onto the J-bolt**]

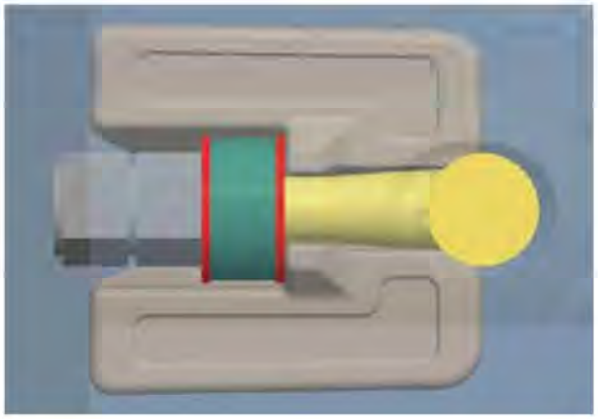

fig. 9-1

SPECIAL NOTE: For best results, it may be necessary to re-torque all fastener components periodically depending on the application. Usually, re-torquing components after a few hours of machine operation will insure component security

J-BOLT SHROUD SEATING AND MAINTENANCE INSTRUCTIONS

SEATING FOR NEW INSTALLATION

It is normal that the shrouds migrate back slightly with the force of the machine. Therefore, it is recommended that the following procedure be followed to ensure proper seating of the shrouds.

Instructions:

1. Run machine for 10 non-production cycles.
2. Remove 2nd locking nut from shroud installation.
3. Re-tighten the 1st locking nut for any movement.
4. Re-install 2nd locking nut
5. Release machine for production.

Note: if the first nut on any installation is excessively loose, then repeat this procedure.

RETIGHTENING AND MAINTENANCE

Check and retighten the nuts after 6 hours of service, then after 24 hrs. Generally, nuts should be periodically checked after 750 to 1000 hrs. in extreme conditions, and 1500 to 2000 hrs. in moderate conditions, or by the frequency dictated by your specific application.

Removing Esco Toplok® Weld Base

STEP 1

To start the conversion, the Toplok® weld base (fig. 1-1) must first be removed. The weld base is welded to a riser that is part of the cast lip (fig. 1-2).

fig. 1-1

fig. 1-2

STEP 2

Before gouging the weld base, be sure to preheat (fig. 2-1) to 180˚ F (820˚ C).

fig. 2-1

STEP 3

Gouge weld-on portion of base (fig. 3-1).

fig. 3-1

J -BOLT INSTALLATION AND WELDING
Convert Esco Loadmaster® to Hensley J-bolt Lip Shrouds

STEP 4
Gouge off the cast riser {if cast riser is present and or creates an issue with the lip shroud template} (fig. 4-1).

fig. 4-1

STEP 5
Grind the gouged area clean and smooth (fig. 5-1).

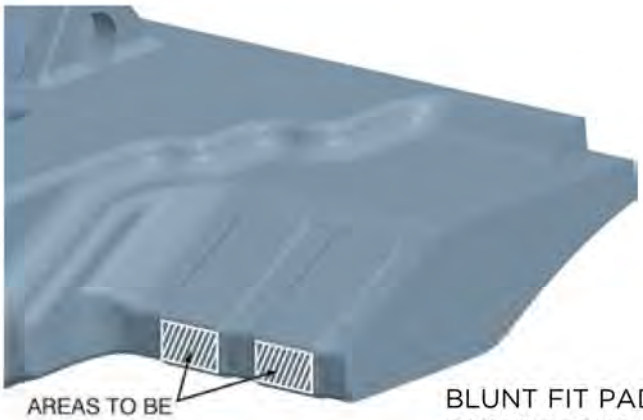
Check Lip Shroud Area for Proper Fit

It may be necessary at this point in the coversion to rebuild worn blunt fit pads in the lip shroud area to Hensley specifications. The rebuilding of blunt fit pads back to within specifications helps insure an acceptable fit. This will help prevent premature failure of the lip shrouds and possibe damage to the cast lip in the lip shroud area.

For gauging and determining if the blunt fit pads need rebuilding, you will need the following tools:

- Grinder
- Templates supplied by Hensley Industries, Inc.
- Feeler gauges (shims)
- Non-Destructive Testing "NDT" Inspection tools
- Welding equipment
- Torch
- Temperature indicating crayon or infrared thermometer

LIP SHROUD AREA REBUILD TEMPLATES	
LIP TEMPLATE	**HX LIP SHROUDS**
LS130MLT	LS130M435J
	LS130M600JBH
LS145LT	LS1451600J
	LS1452200J
LS1301700LT	LS1301700J
LS8002200LT	LS8002200J



BLUNT FIT PAD REBUILD SHOULD ONLY OCCUR IN THESE AREAS.

Lip Shroud Area Gauging

BEFORE STARTING GAUGING, BE SURE TO READ ALL INSTRUCTIONS THOROUGHLY!

STEP 1

Prepare the lip shroud area for gauging by:

- Thoroughly clean excess material from the lip shroud area (top & bottom).
- Check top surface area for flatness within 1/16" (1.6mm) and build-up if necessary.

STEP 2

Centering the template on the LIP SHROUD FIT PAD AREA (fig. 2-1), slide it onto the lip. Be sure to maintain contact with the top surface of the cast lip (fig. 2-2)

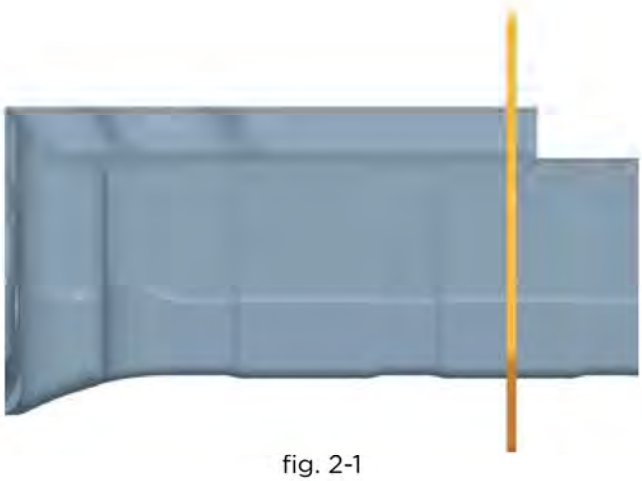


fig. 2-1

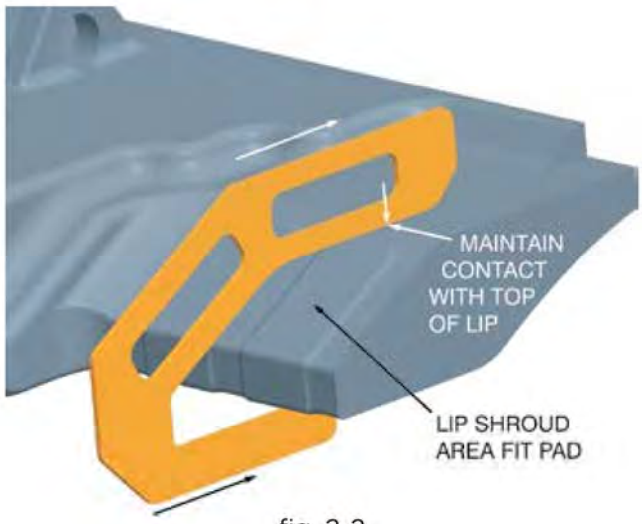

fig. 2-2

J -BOLT INSTALLATION AND WELDING
Convert Esco Loadmaster® to Hensley J-bolt Lip Shrouds

STEP 3

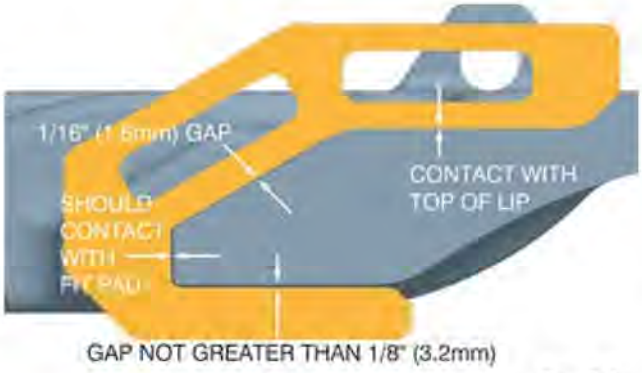

fig. 3-1

Maintaining contact with the top surface of the cast lip slide the template onto the lip until there is a 1/16" (1.6mm) gap between the bevel area of the template and the bevel area of the cast lip. There should also be a gap between the bottom of the template and the bottom of the cast lip (fig. 3-1).
Once the 1/16" (1.6mm) gap between the bevel of the lip and template is reached, check to see if the blunt of the template is contacting the blunt fit pad. If the template does not contact the fit pad, measure the gap. This measurement indicates the amount of the blunt that needs to be built up.

FOR MAXIMUM GAP TOLERANCES REFER TO GAP TOLERANCE CHART (fig. 3-2).

GAP TOLERANCES	
FIT AREA	**MAXIMUM GAP**
blunt	contact 2 points minimum
bevel	1/16" (1.6mm)
top	contact 2 points minimum
bottom	1/8" (3.2mm)

fig. 3-2

Blunt Fit Pad Build-Up

BEFORE STARTING BLUNT FIT PAD BUILD-UP, BE SURE TO READ ALL INSTRUCTIONS THOROUGHLY!

NOTE: FILLER MATERIALS RECOMMENDED FOR THE BUILD-UP OF FIT PADS ARE HIGH TENSILE STRENGTH FILLER MATERIALS. THEY ARE RECOMMENDED DUE TO THEIR SURFACE HARDNESS PROPERTIES. THEY SHOULD NOT BE USED TO WELD OTHER HENSLEY G.E.T. PRODUCTS.

NOSE BUILD-UP FILLER MATERIAL			
PROCESS	**AWS**	**JIS**	**SHIELDING GAS**
SMAW	*E9018 AWS A5.5	JIS Z3212 D5816	N/A
FCAW	*E91t-1 AWX A5.29	JIS Z3313 YFL-A506R	75% AR / 25%CO2

*Minimum tensile requirement. Higher tensile strength filler materials may be used, such as SMAW E12018 or FCAW E110T5-K4.

Preheat the fit pad to be built-up. Preheat the fit pad to between 300˚F / 150˚C to 450˚F / 230˚C and maintain this temperature throughout the welding process. Temperature may be checked with an infrared thermometer or a temperature indicating crayon.

Build up the fit pad with weld to close the gap between the fit pad and template. Stringer beads are recommended. The use of weave or wash beads should not be used, however weaving is permitted as long as bead widths are no greater than 0.50" [12.7mm].

Clean each pass of deposited weld metal before depositing the next weld pass. Manual slag hammers, pneumatic needle gun, wire brushes or any combination of these tools may be used to accomplish cleaning. Deposit slightly more weld than what is required. This will allow the fit areas to be ground smooth without any weld under fill.

Before dressing / grinding the welds. allow the fit pad to cool to ambient temperature. A cool down rate of no greater than 45˚F / 25˚C per hour is recommended.

Using the template appropriate for your lip, re-check for proper fit. Remember that the template should contact the top of the lip surface and have a 1/16" (1.6mm) gap at the bevel (fig. A-1). If this gap is achieved with the template contacting the blunt fit pad, you are ready to finish dressing / grinding the welds. Dress / grind the blunt fit pad surfaces so that they are flat and parallel to the pin hole in the nose (fig. A-2).

Grind the weld beads so that there is a smooth transition between adjoining beads and a smooth transition into the original fit pad material.

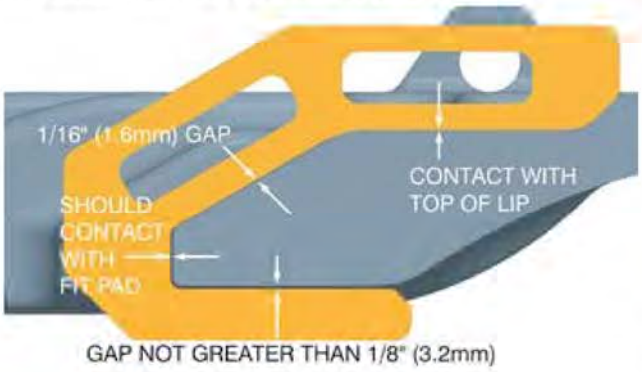

fig. A-1

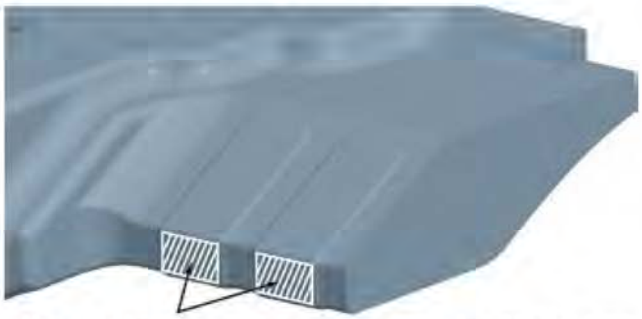

CHECK THAT RE-BUILT BLUNT FIT PAD SURFACES ARE FLAT AND PARALLEL TO PIN HOLE IN NOSE

fig. A-2

Installation of Hensley Weld Base

REPLACEMENT INSTALLATION

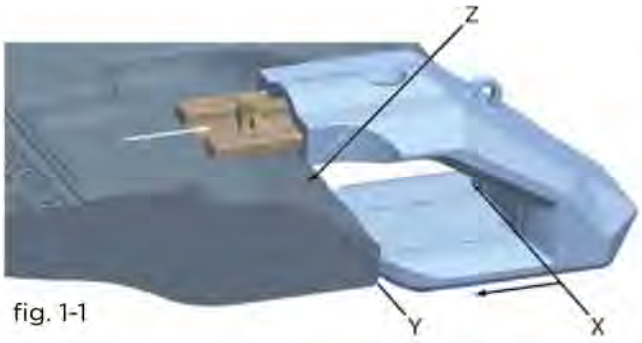

fig. 1-1

STEP 1

After having ground the top surface of the lip material that will be affected by weld, insure all carbon slag or other impurities from the removal of the old base are ground out. The use of non-destructive testing at this point will help determine if there are any cracks present in the base material. Repair base material as needed. (Now proceed as with the installation.)

1 a) Slide weld base into back of lip shroud.
1 b) Position the shroud on the cast lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the lip "Y". There should be **no** contact between the bevel of the shroud and area "Z" of the cast lip (fig. 1-1).

NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

fig. 2-1

STEP 2

Align the back of the Weld base so that it is flush with the back of shroud (fig. 2-1).

J -BOLT INSTALLATION AND WELDING
Convert Esco Loadmaster® to Hensley J-bolt Lip Shrouds

STEP 3
After weld-base placement has been confirmed, establish a preheat temperature of 300°F / 150°C to 450°F / 230°C for the base material. Then tack weld the base at the rear along weld prep surface "A" (fig.3-1).

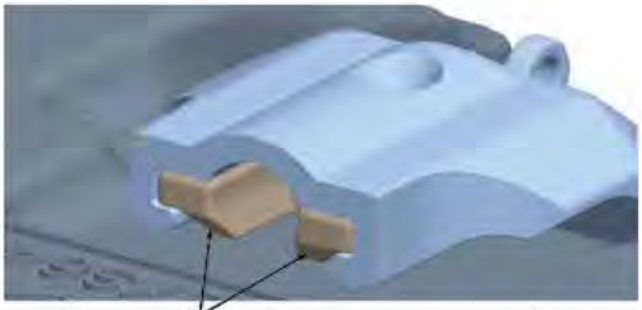

fig. 3-1

SPECIAL NOTES

Recommended filler material: AWS specification A5.1, class E7018 stick electrode. Stick electrodes should be kept in a heated rod oven at 250°F / 120°C prior to use.

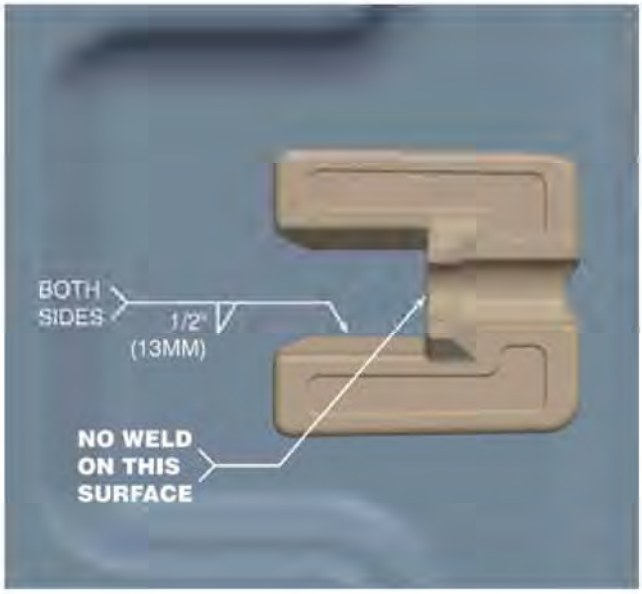
NOTE: See manufacturer's recommended procedures for storage and preservation of low hydrodgen electrodes.

Recommended weld types: Stringer beads are recommended for higher strength and less distortion.The use of weave or wash beads in **NOT** recommended and should not be used. Arc strikes should be avoided or ground down.

STEP 4
Remove the shroud and prepare to weld-out the base by re-establishing a preheat temperature of 300°F / 150°C to 450°F / 230°C for the base material (fig. 4-1). Maintain this temperature throughout the welding process.

fig. 4-1

J -BOLT INSTALLATION AND WELDING
Convert Esco Loadmaster® to Hensley J-bolt Lip Shrouds



STEP 5
Weld-out for the base should begin with the inner legs of base. A 1/2" (13mm) fillet weld should be deposited in this area (fig. 5-1).

BE SURE THAT THE ENTIRE BOTTOM SURFACE OF THE WELD BASE MAINTAINS CONTACT WITH THE LIP DURING ENTIRE WELD-OUT PROCESS.

fig. 5-1

fig. 6-1

STEP 6
Apply weld to the base perimeter next. Utilizing groove welds, fill the 1.0" (25mm) weld groove on the base completely (fig. 6-1 & fig. 6-2). Care must be taken at this point not to add too much weld. If joint is over welded, the weld material can interfere with the lip shroud. The idea is to add as much weld as possible to the base without causing interference with the lip shroud (fig. 6-3). When the welding process has been completed, allow a slow cool down period to ambient temperature. A cool down rate of no greater than 45°F / 25°C per hour is recommended.

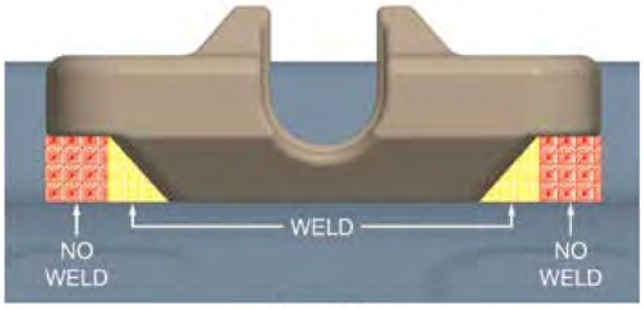


fig. 6-2

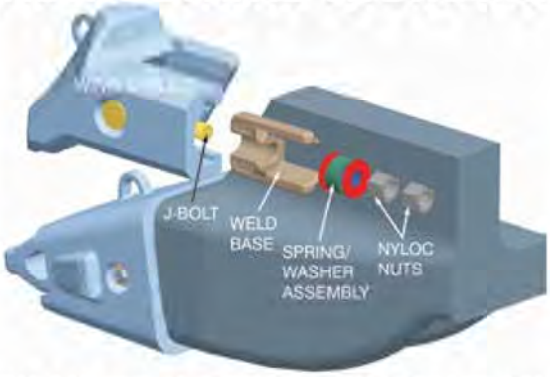
J -BOLT INSTALLATION AND WELDING

Lower Wing Shrouds for Loadmaster® & Cast Lips

BEFORE STARTING INSTALLATION, BE SURE TO READ ALL INSTRUCTIONS THOROUGHLY!

STEP 1



NEW AND REPLACEMENT INSTALLATION

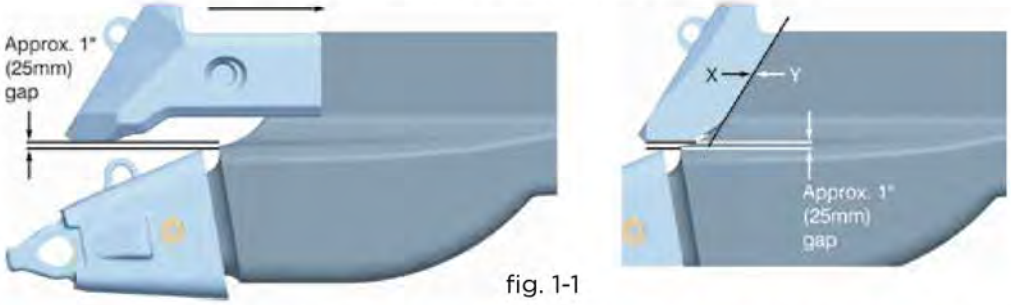


fig. 1-1

NEW INSTALLATION

Position the wing shroud on cheek plate portion of the cast lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the cheek plate "Y". The shroud should be positioned so that there is approximately a 1" (25mm) gap between the bottom of the shroud and the intermediate adapter.
(fig. 1-1).

NOTE: This contact and gap must be maintained throughout the assembly process to insure the proper location of the weld base.

FOR 201" LIP - The angle of the blunt front surface of the cheek plate "Y" differs from the 163" & 169" lips.The shroud should still be positioned so that there is approximately a 1" (25mm) gap between the bottom of the shroud and the intermediate adapter (fig. 1-1).

REPLACEMENT INSTALLATION

Grind the outside portion of the cheek plate area of the cast lip that will be affected by weld. Insure all carbon slag or other impurities from the removal of the old base are ground out. The use of non-destructive testing at this point will help determine if there are any cracks present in the base material. Repair base material as needed. (Now proceed as with new installation.)

Position the wing shroud on cheek plate portion of the cast lip making sure that the blunt throat surface of the shroud “X" contacts the blunt front surface of the cheek plate “Y". The shroud should be positioned so that there is approximately a 1" (25mm) gap between the bottom of the shroud and the intermediate adapter. (fig. 1-1).

NOTE: This contact and gap must be maintained throughout the assembly process to insure the proper location of the weld base.

J -BOLT INSTALLATION AND WELDING
Lower Wing Shrouds for Loadmaster® & Cast Lips

STEP 2

FOR 163" & 169" LIPS

Insert the weld base as shown into the rear of the wing shroud until it is flush with the rear of the wing shround (fig. 2-1 - fig. 2-2)

fig. 2-1

fig. 2-2

FOR 201" LIPS

Due to the difference in the angle of the cheek plate for 201" lips, following proper placement (STEP 1) procedures will result in the wing shroud being rotated 5˚ off horizontal (fig. 2-1-201). This is by design. All remaining installation instructions can now be implemented.

Insert the weld base as shown into the rear of the wing shroud until it is flush with the rear of the wing shround (fig. 2-1-201 - fig. 2-2-201).

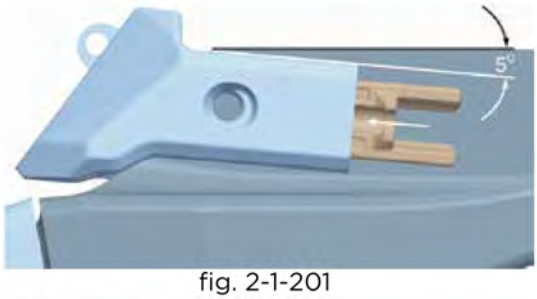

fig. 2-1-201

fig. 2-2-201

STEP 3

After placement of weld base has been confirmed, Pre-heat the base material to 300˚F / 150˚C to 450˚F / 230˚C and tack weld the base at the rear along weld prep surface "A" (fig.3-1).

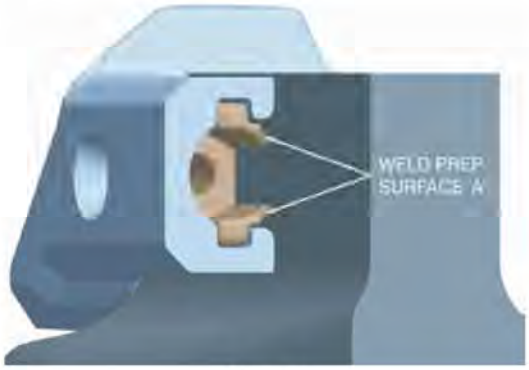

fig. 3-1

J -BOLT INSTALLATION AND WELDING
Lower Wing Shrouds for Loadmaster® & Cast Lips

SPECIAL NOTES

Recommended filler material: AWS specification A5.1, class E7018 stick electrode. Stick electrodes should be kept in a heated rod oven at 250°F / 120°C prior to use.

NOTE: See manufacturer's recommended procedures for storage and preservation of low hydrodgen electrodes.

Recommended weld types: Stringer beads are recommended for higher strength and less distortion. The use of weave or wash beads in **NOT** recommended and should not be used. Arc strikes should be avoided or ground down.

STEP 4

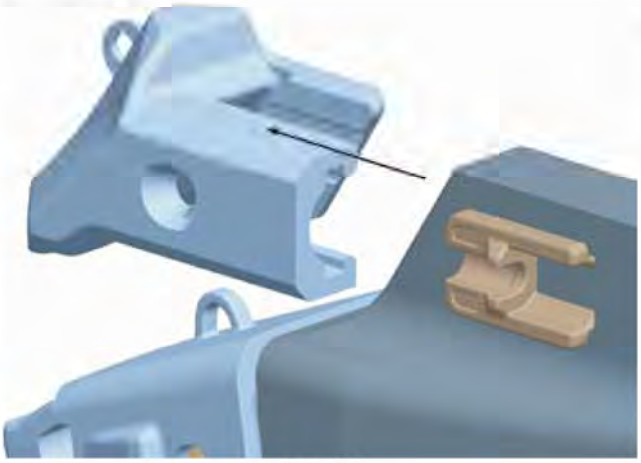

fig. 4-1

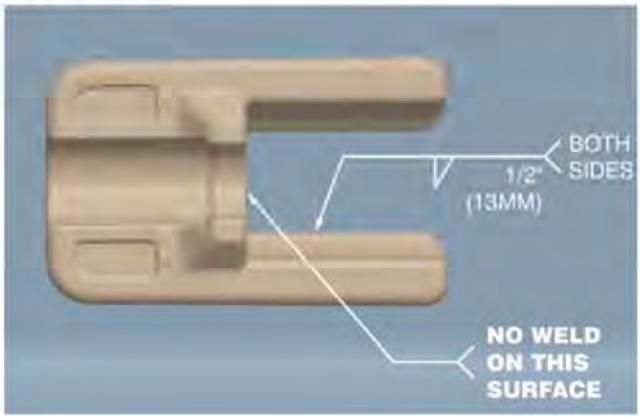
Remove the shroud and prepare to weld-out the base by re-establishing the preheat temperature of 300°F / 150°C to 450°F / 230°C for the base material (fig. 4-1). Maintain this temperature throughout the welding process.

STEP 5



Weld-out for the base should begin with the inner legs of base. A 1/2" (13mm) fillet weld should be deposited in this area (fig. 5-1).

BE SURE THAT THE ENTIRE BOTTOM SURFACE OF THE WELD BASE MAINTAINS CONTACT WITH THE CHEEK PLATE DURING ENTIRE WELD-OUT PROCESS

J -BOLT INSTALLATION AND WELDING
Lower Wing Shrouds for Loadmaster® & Cast Lips

STEP 6

Apply weld to the base perimeter next. Utilizing groove welds, fill the 1.0" (25mm) weld groove on the base completely (fig. 6-1 & fig. 6-2). Care must be taken at this point not to add too much weld. If joint is over welded, the weld material can interfere with the lip shroud. The idea is to add as much weld as possible to the base without causing interference with the lip shroud (fig. 6-3). When the welding process has been completed, allow a slow cool down period to ambient temperature. A cool down rate of no greater than 45°F / 25°C per hour is recommended.

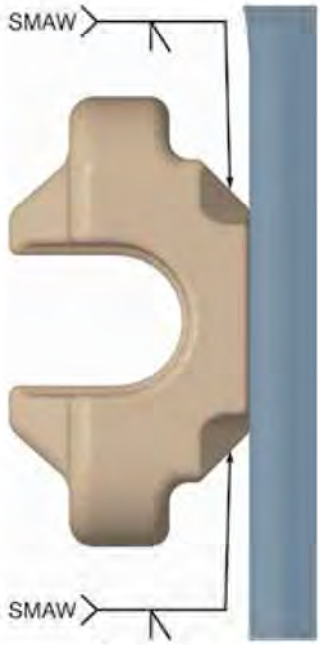


fig. 6-1

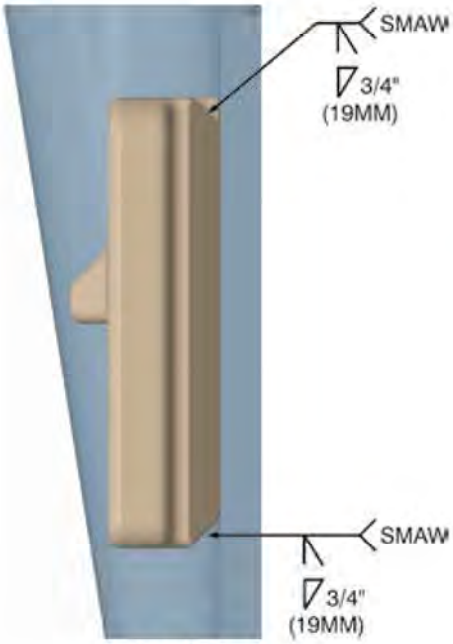

fig. 6-2

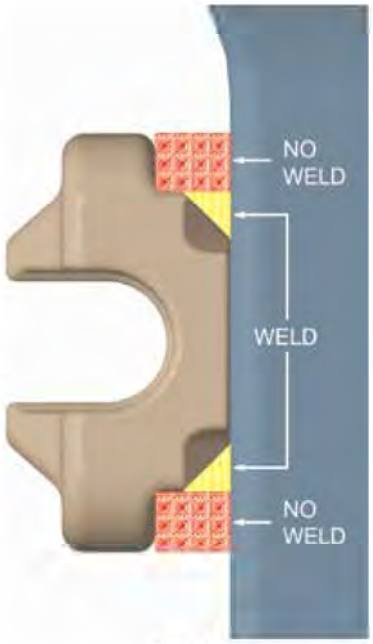

fig. 6-3

J -BOLT INSTALLATION AND WELDING
Lower Wing Shrouds for Loadmaster® & Cast Lips

STEP 7

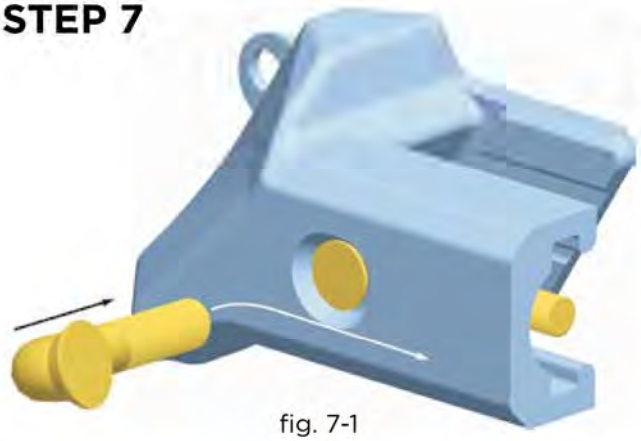

fig. 7-1

Before repositioning the shroud on the cheek plate, insert the J-bolt into the shroud through the top hole (fig. 7-1). Rotate the bolt 90° so that the threaded end is facing the rear of the shroud.

STEP 8

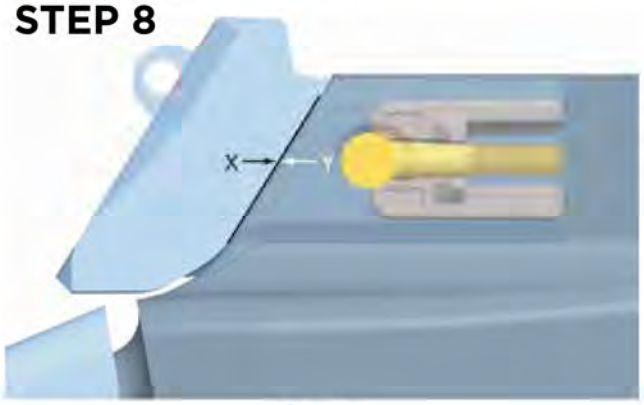

fig. 8-1

Reposition the shroud on the cheek plate by sliding it onto the weld base as far as it will go, once again, making sure surface "X" contacts surface "Y"
(fig. 8-1).

STEP 9

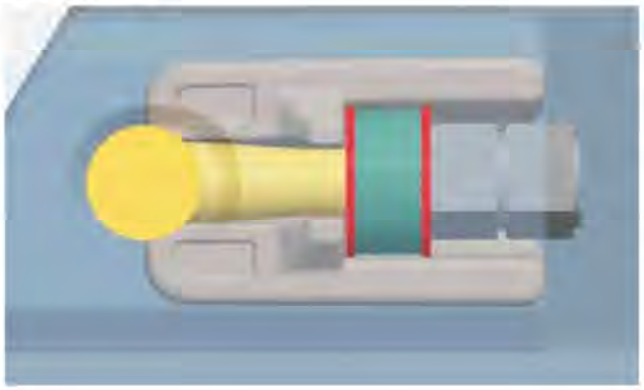

fig. 9-1

Install the washer, spring, collar assembly and the nuts in the order indicated for J-bolt assembly type J6 (fig. 9-1), Torque locking nuts to 300 ft. lbs / 407 Nm.

[NOTE: the locking nut cannot be hand-threaded onto the J-bolt]

SPECIAL NOTE:For best results, it may be necessary to re-torque all fastener components periodically depending on the application. Usually, re-torquing components after a few hours of machine operation will insure component security

J-BOLT SHROUD SEATING AND MAINTENANCE INSTRUCTIONS

SEATING FOR NEW INSTALLATION

It is normal that the shrouds migrate back slightly with the force of the machine.
Therefore, it is recommended that the following procedure be followed to ensure proper seating of the shrouds.

Instructions:

1. Run machine for 10 non-production cycles.
2. Remove 2nd locking nut from shroud installation.
3. Re-tighten the 1st locking nut for any movement.
4. Re-install 2nd locking nut
5. Release machine for production.

Note: if the first nut on any installation is excessively loose, then repeat this procedure.

RETIGHTENING AND MAINTENANCE

Check and retighten the nuts after 6 hours of service, then after 24 hrs. Generally, nuts should be periodically checked after 750 to 1000 hrs. In extreme conditions, and 1500 to 2000 hrs. In moderate conditions, or by the frequency dictated by your specific application.

SPECIAL NOTE
For best results, it may be necessary to re-torque all fastener components periodically depending on the application. Usually, re-torquing components after a few hours of machine operation will insure component security.

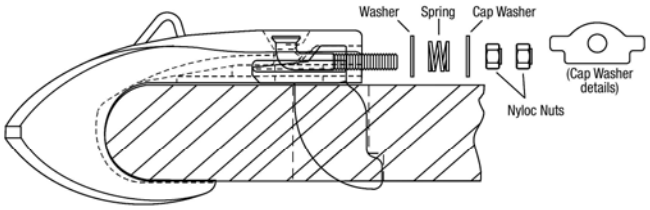
J-BOLT INSTALLATION USING WELD-ON BASE

IMPORTANT NOTE: READ ALL OF THE INSTRUCTIONS COMPLETELY PRIOR TO ASSEMBLY



Typical Shroud Assembly With Hardware (Not all assemblies use all hardware shown.)

IMPORTANT NOTE: BEFORE starting any welding, it must be determined if the cast lip is CARBON ALLOY or MANGANESE due to different preheat and filler material requirements. A CARBON ALLOY lip is magnetic; a MANGANESE lip is not. Use a magnet to determine your lip type and follow the appropriate welding procedures as laid out in the following steps.

STEP 1- NEW INSTALLATION

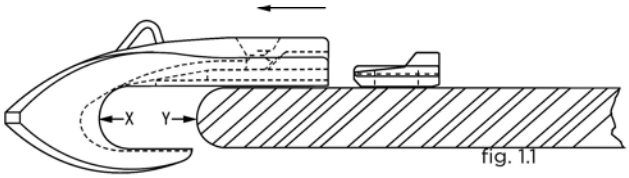


fig. 1.1

Position the shroud on the lip making sure that the throat surface of the shroud "X" contacts the front surface of the lip "Y". (fig. 1.1).
NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

STEP 1- REPLACEMENT INSTALLATION

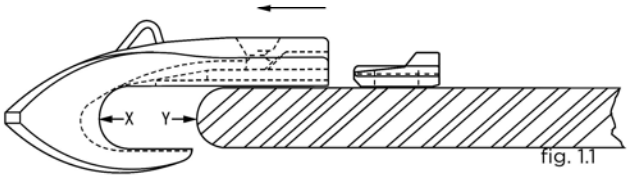

fig. 1.1

Grind the top surface of the lip material that will be affected by weld. Insure all carbon slag or other impurites from the removal of the old base are ground out. The use of non-destructive testing at this point will help determine if there are any cracks present in the base material. Repair base material as needed. (Now proceed as with new installation.)
Position the shroud on the lip making sure that the throat surface of the shroud "X" contacts the front surface of the lip "Y" (fig. 1.1).
NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Dippers

STEP 2

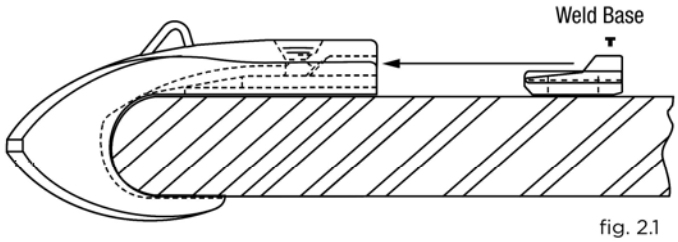

fig. 2.1

Slide the weld base from the rear into the receiving slots of the shroud (fig. 2.1)

STEP 3

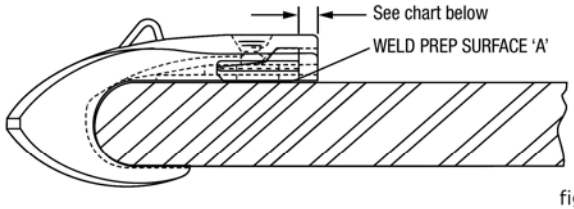

fig. 3.1

MANGANESE ALLOY CAST STEEL LIP
Position the weld base according to the chart below (a deviation of 33/32" (2.5 mm) is allowable). After placement has been confirmed, determine if preheating of the base material is necessary. If the base metal temperature is above 40˚F(4.4˚C) **NO** preheat is required. If the base metal temperature is below 40˚F(4.4˚C), the base metal MUST BE preheated to a minimum of 70˚F(21˚C). Once preheat requirements are determined and met, tack weld the base at the rear along weld prep surface "A" (fig. 3.1).

CARBON ALLOY CAST STEEL LIP
Position the weld base according to the chart below (a deviation of 33/32" (2.5 mm) is allowable). After placement has been confirmed, preheat the base material to 300˚F/147˚C and tack weld the base at the rear along weld prep surface "A" (fig. 3.1).

WELD BASE PLACEMENT
(33/32" (2.5mm) allowable)

BASE	INCHES	MM
LSWB1	2-1/4"	(57)
LSWB2	2-1/4"	(57)
LSWB3	2-1/4"	(57)
LSWB5	2-1/4"	(57)

STEP 4

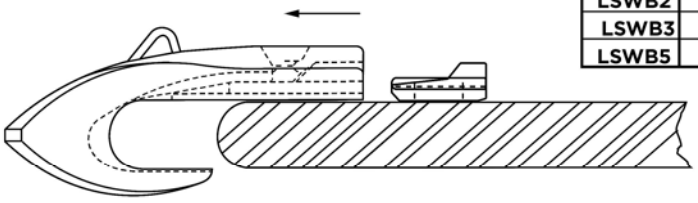

fig. 4.1

MANGANESE ALLOY CAST STEEL LIP
Remove the shroud and prepare to weld-out the base by determining if reheating of the base material (fig. 4.1) is necessary. If the base metal temperature is above 40˚F(4.4˚C) reheating is NOT required. If the base metal temperature is below 40˚F(4.4˚C), the base metal MUST BE reheated to a minimum of 70ºF(21˚C). Maintain this temperature throughout the welding process.

CARBON ALLOY STEEL LIP
Remove the shroud and prepare to weld-out the base by re-establishing the preheat temperature of 30˚˚F/147˚C for the base material (fig. 4.1). Maintain this temperature throughout the welding process.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Dippers

SPECIAL NOTES

Recommended filler material: **Carbon Alloy Cast Steel Lip**
AWS specification A5.1, class E7018, stick electrode.

Manganese Alloy Cast Steel Lip
AWS specification A5.4, class E308L-16, stick electrode.

NOTE: Stick electrodes should be kept in a heated rod oven at 250˚/120˚C prior to use. See manufacturers recommended procedures for storage and preservation of low hydrogen and stainless steel electrodes.

Recommended weld types: Recommended weld types: Stringer beads are recommended for higher strength and less distortion. The use of weave or wash beads is **NOT** recommended and should not be used. Arc strikes should be avoided or ground down.

STEP 5

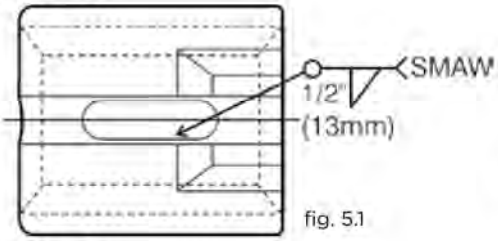

fig. 5.1

Weld-out for the base should begin with the slot weld. A 1/2"(13mm) fillet weld should be deposited in this area (fig. 5.1).

BE SURE THAT THE ENTIRE BOTTOM SURFACE OF THE WELD BASE MAINTAINS CONTACT WITH THE LIP DURING ENTIRE WELD-OUT PROCESS.

STEP 6

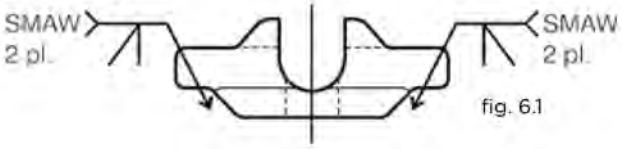

fig. 6.1

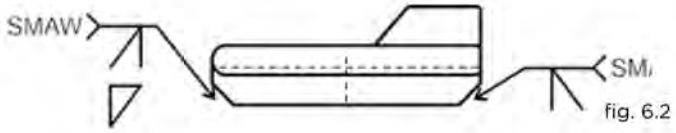

fig. 6.2

Apply weld to the base perimeter next. Utilizing groove welds, fill the 1/2"(13mm) weld groove on the base completely (fig. 6.1 & fig. 6.2). Care must be taken at this point not to add too much weld. If joint is over welded, the weld material can interfere with the lip shroud. The idea is to add as much weld as possible to the base without causing interference with the lip shroud (fig. 6.3 & fig. 6.4) When the welding process has been completed, allow a slow cool down period to ambient temperature. A cool down rate of no greater than 35OF/2OC per hour is recommended.

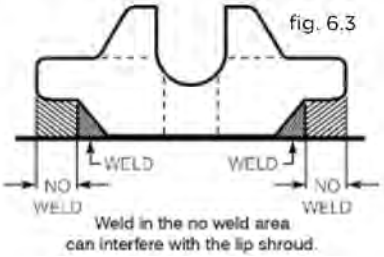

fig. 6.3

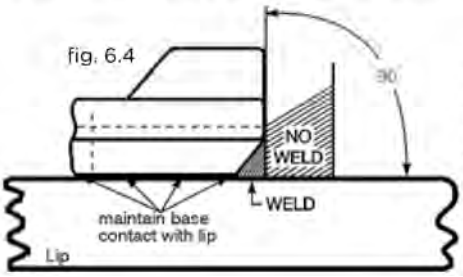

fig. 6.4

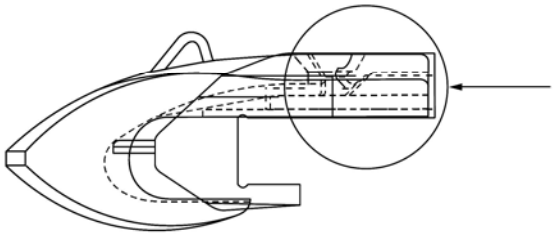
Weld in this area will interfere with the front washer of the J-Bolt assembly which must fit flush against the rear of the weld base.

Ensure contact with lip on entire length of weld base bottom surface as indicated.

STEP 7



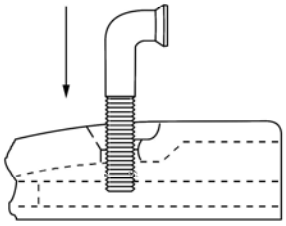


fig. 7.1

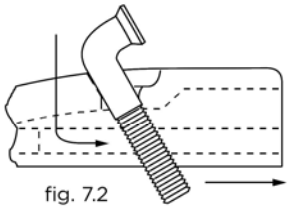

fig. 7.2

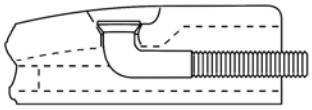

fig. 7.3

Before repositioning the shroud on the lip, insert the J-bolt into the shroud through the top hole (fig. 7.1). Rotate the bolt 90˚ so that the threaded end is facing the rear of the shroud (figs. 7.2 - 7.3).

STEP 8

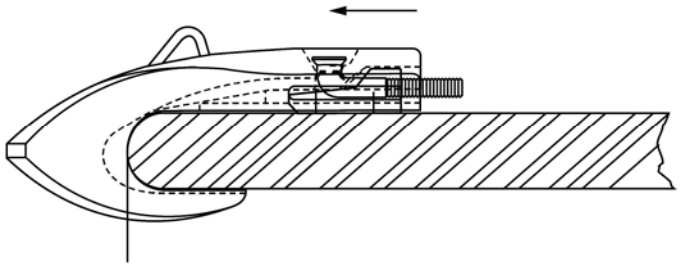

fig. 8.1

Reposition the shroud on the lip by sliding it onto the weld base as far as it will go, once again, making sure surface “X" contacts surface “Y"(fig. 8.1).

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for Dippers

STEP 9A

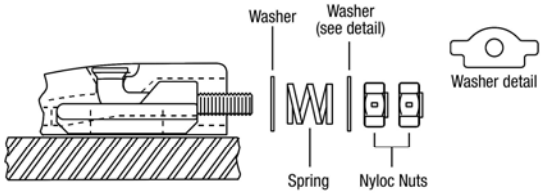

fig. 9.1A

Attach the round washer, spring, cap washer and the nuts in the order indicated for J-bolt assembly (SFA1J5) (fig. 9.1A), **[NOTE: the locking nut cannot be hand-threaded onto the J-bolt]** then torque to specifications listed. (fig. 9.2)

STEP 9B

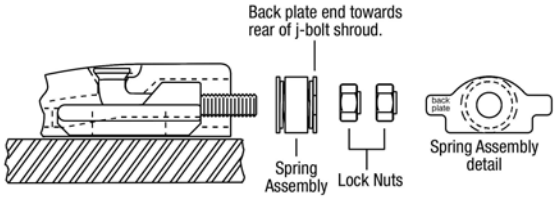

fig. 9.1B

Attach the washers, the spring and the nuts in the order indicated for J-bolt assembly (SFA118J) (fig. 9.1B) **[NOTE: the Grade 8 nuts cannot be hand-threaded onto the J-bolt]** then torque to specifications listed. (fig. 9.2).

J-Bolt Assembly Torque Recommendations

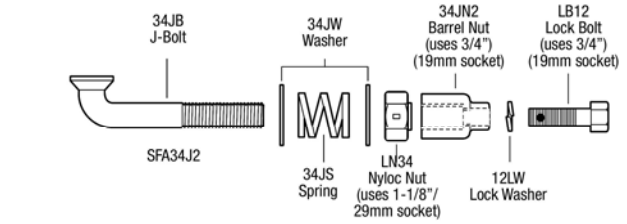
J-BOLT ASSEMBLY	LOCKING NUT		GRADE 8 BOLT	
Part No.	ft-lbs	Nm	ft-lbs	Nm
SFA1J5	271	NA	NA	NA
SFA118J	NA	NA	200	271

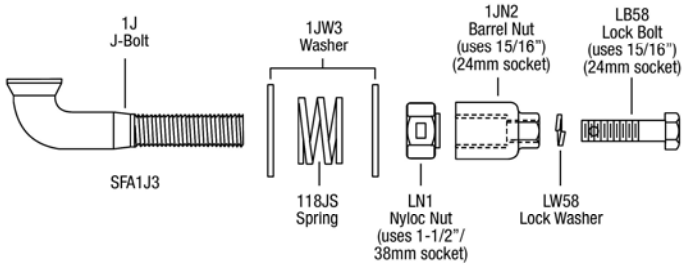
fig. 9.2

SPECIAL NOTE
For best results, it may be necessary to re-torque all fastener components periodically depending on the application. Usually, re-torquing components after a few hours of machine operation will insure component security.

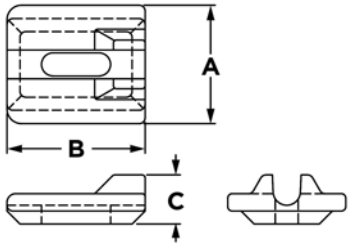
J -BOLT INSTALLATION AND WELDING
Lip Shrouds for LHD Scoop Trams

J-bolt Assemblies





Weld Base



J-BOLT BASES								
Part No.	Dimensions						Weight

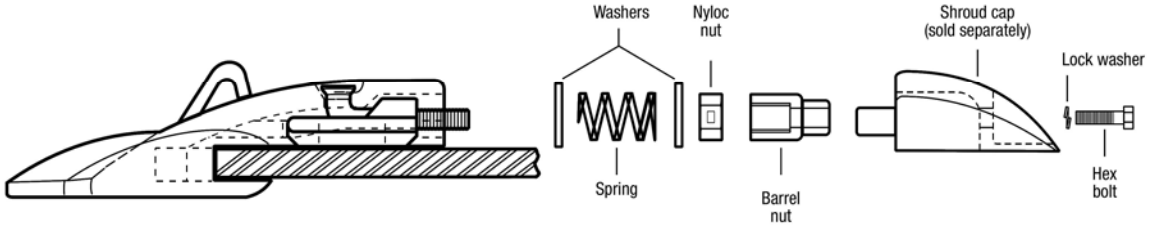
LSWB-3	3.9	98	4.5	114	1.4	36	3.2	1.5

IMPORTANT NOTE: READ ALL OF THE INSTRUCTIONS COMPLETELY PRIOR TO ASSEMBLY



Typical Shroud Assembly With Hardware
(Not all assemblies use all hardware shown.)

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for LHD Scoop Trams

STEP 1- NEW INSTALLATION

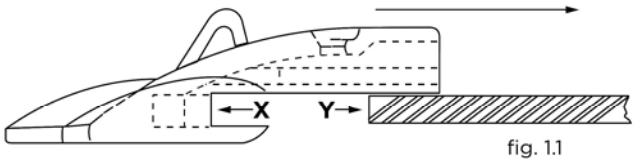


fig. 1.1

Position the shroud on the lip making sure that the **blunt** throat surface of the shroud "X" contacts the blunt front surface of the lip "Y" (fig. 1.1).

NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

STEP 1- REPLACEMENT INSTALLATION

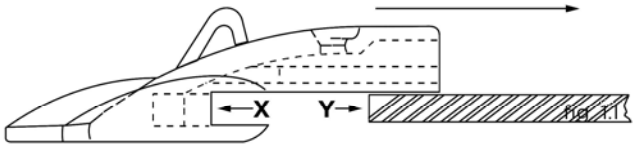

fig. 1.1

Grind the top surface of the lip material that will be affected by weld. Insure all carbon slag or other impurites from the removal of the old base are ground out. The use of non-destructive testing at this point will help determine if there are any cracks present in the base material. Repair base material as needed. (Now proceed as with new installation.)

Position the shroud on the lip making sure that the **blunt** throat surface of the shroud "X" contacts the **blunt** front surface of the lip "Y" (fig. 1.1).

NOTE: This contact must be maintained throughout the assembly process to insure the proper location of the weld base.

STEP 2

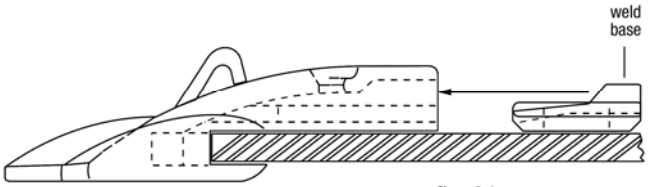

fig. 2.1

Slide the weld base from the rear into the receiving slots of the shroud (fig. 2.1)

STEP 3

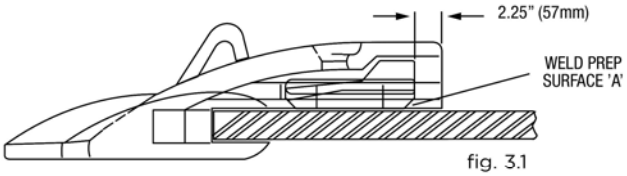

fig. 3.1

After placement has been confirmed, preheat the base material to 30˚F/147˚C and tack weld the base at the rear along weld prep surface "A" (fig.3.1).

STEP 4

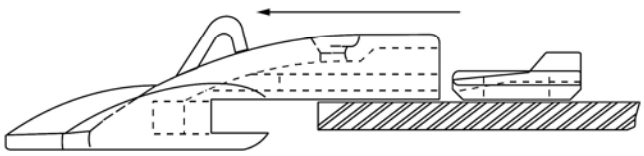

fig. 4.1

Remove the shroud and prepare to weld-out the base by re-establishing the preheat temperature of 300˚F/147˚C for the base material (fig4.1). Maintain this temperature throughout the welding process.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for LHD Scoop Trams

SPECIAL NOTES

Recommended filler material: AWS specification A5.1, class E7018, stick electrode. Stick electrodes should be kept in a heated rod ovenat 250˚/120˚C prior to use

NOTE: See manufacturers recommended procedures for storage and preservation of low hydrogen electrodes.

Recommended weld types: Stringer beads are recommended for higher strength and less distortion. The use of weave or wash beads is **NOT** recommended and should not be used. Arc strikes should be avoided or ground down.

STEP 5

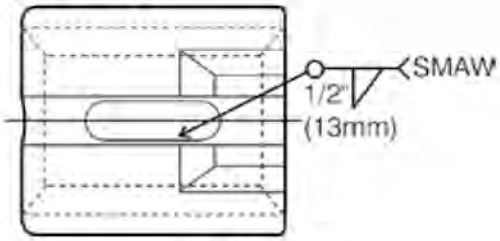

fig. 5.1

Weld-out for the base should begin with the slot weld. A 1/2"(13mm) fillet weld should be deposited in this area (fig. 5.1).
BE SURE THAT THE ENTIRE BOTTOM SURFACE OF THE WELD BASE MAINTAINS CONTACT WITH THE LIP DURINGENTIRE WELD-OUT PROCESS.

STEP 6

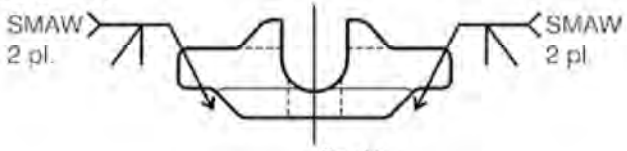

fig. 6.1

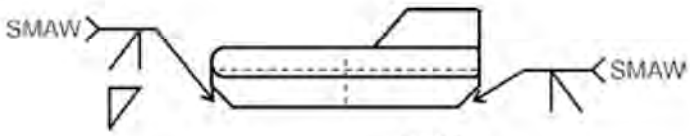

fig. 6.2

Apply weld to the base perimeter next. Utilizing groove welds, fill the 1/2"(13mm) weld groove on the base completely (fig. 6.1 & fig. 6.2). Care must be taken at this point not to add too much weld. If joint is over welded, the weld material can interfere with the lip shroud. The idea is to add as much weld as possible to the base without causing interference with the lip shroud (fig. 6.3 & fig. 6.4)

When the welding process has been completed, allow a slow cool down period to ambient temperature. A cool down rate of no greater than 35˚F/2˚C per hour is recommended.

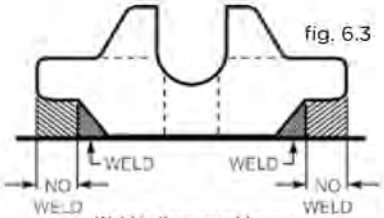

fig. 6.3
Weld in the no weld area can interfere with the lip shroud.

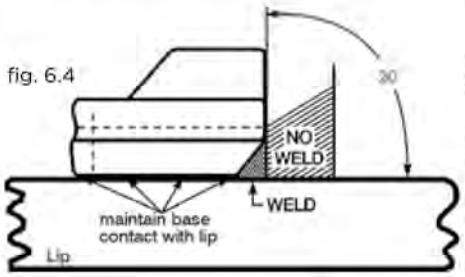

fig. 6.4

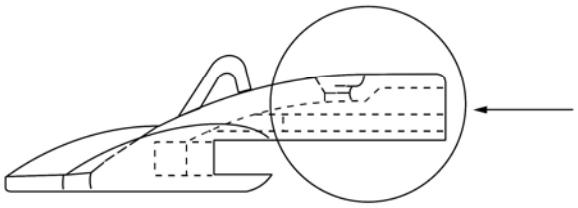
Weld in this area will interfere with the front washer of the J-Bolt assembly which must fit flush against the rear of the weld base.

Ensure contact with lip on entire length of weld base bottom surface as indicated.

J -BOLT INSTALLATION AND WELDING
Lip Shrouds for LHD Scoop Trams

STEP 7



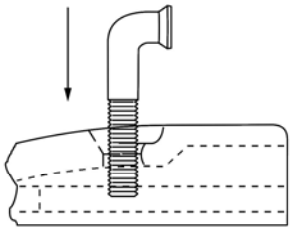


fig. 7.1

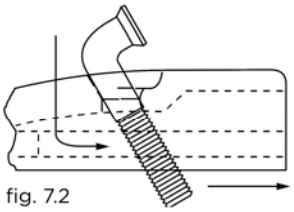

fig. 7.2

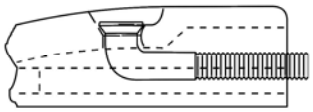

fig. 7.3

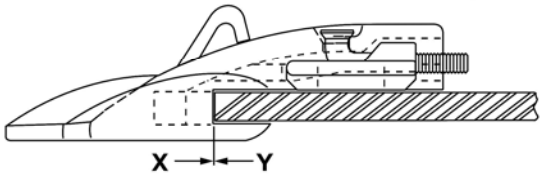
Before repositioning the shroud on the lip, insert the J-bolt into the shroud through the top hole (fig. 7.1). Rotate the bolt 90˚ so that the threaded end is facing the rear of the shroud (figs. 7.2 - 7.3).

STEP 8

fig. 8.1



Reposition the shroud on the lip by sliding it onto the weld base as far as it will go, once again, making sure surface “X"contacts surface “Y"(fig. 8.1).

STEP 9 (J2 & J3 J-bolt Assemblies)

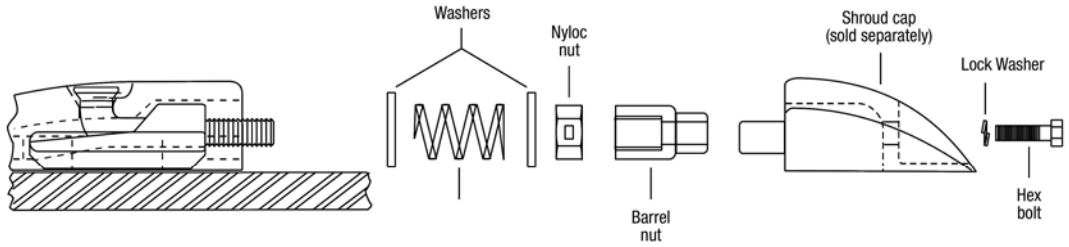


fig. 9.1

Attach the washers, the spring and the nuts in the order indicated for J-bolt assembly type J4. (fig. 9.1),
[NOTE: the locking nut cannot be hand-threaded onto the J-bolt] then torque to specifications listed. (fig. 9.2).

J-Bolt Assembly Torque Recommendations

J-BOLT ASSEMBLY	LOCKING NUT		GRADE 8 BOLT	
	ft-lbs	Nm	ft-lbs	Nm
SFA34J2	175	237	NA	NA
SFA1J3	271	NA	NA	NA

fig. 9.2

SPECIAL NOTE
For best results, it may be necessary to re-torque all fastener components periodically depending on the application. Usually, re-torquing components after a few hours of machine operation will insure component security.

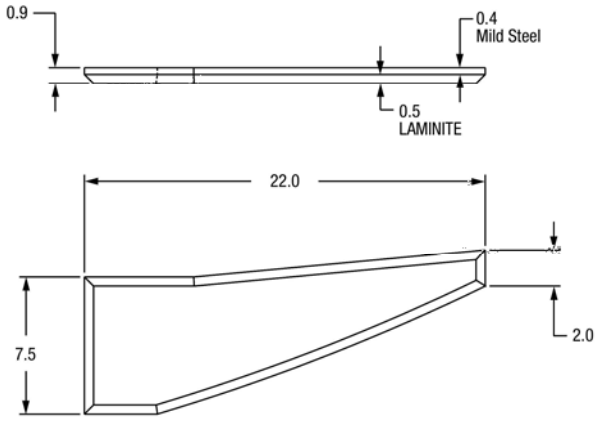
SPECIALTY LAMINITE PRODUCTS
LAMINITE

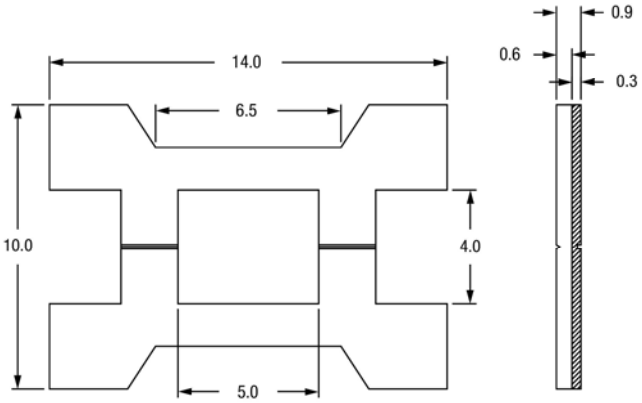
SIDE PROTECTORS FOR HENSLEY HYDRAULIC SHOVEL CAST LIPS

SDP1337AL (LH shown)
SDP1337BR (RH opposite)
28.0 lb / 12.7 kg



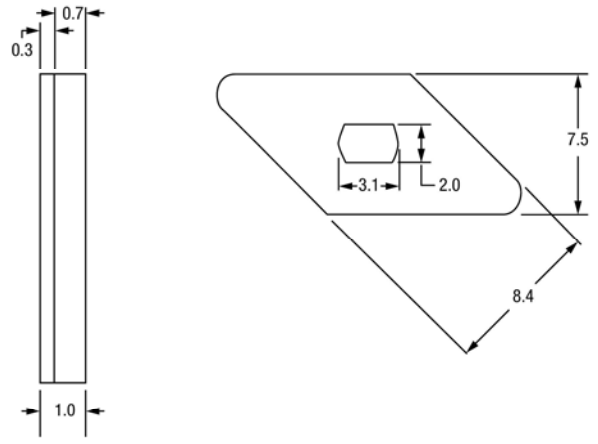
TRUCK BED LINERS

DLP 4957
19.0 lb / 8.6 kg



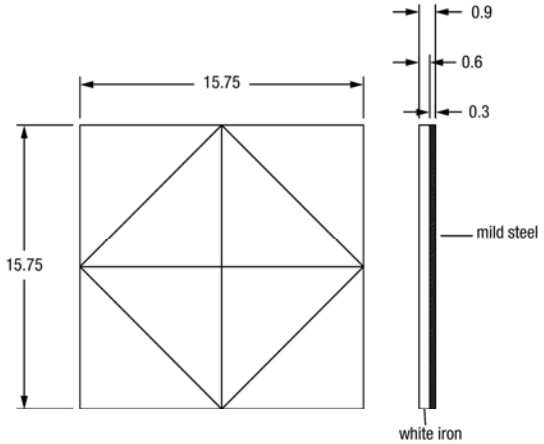
TRAPEZOIDAL PLATE

DLP1935
22.1 lb / 10.0 kg



STAR PLATE

DLP2180
63.2 lb / 28.7 kg



Note: Measurements are in inches.

LAMINITE® BENDING DETAILS FOR "CHOCKY" BARS

READ BENDING INSTRUCTIONS COMPLETELY

1 Clean the surface to which "chocky" bar will be welded.

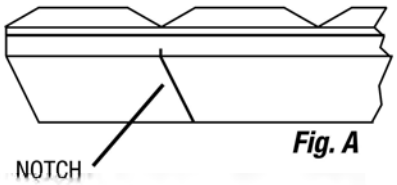


Fig. A

2a **FOR OUTSIDE CURVES:** Tack weld one end of "chocky" bar (per welding procedures) in at least 3 places using at least **15mm** of weld in each deposit. **(Fig.1)** Hammer down unwelded end of bar so that the bar bends and follows the curve. **(Fig.2)**

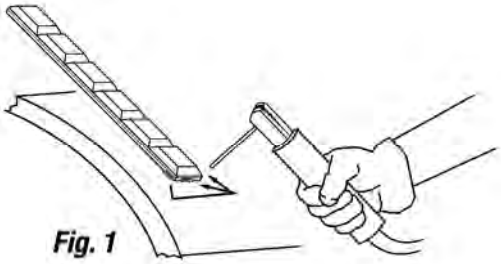

Fig. 1

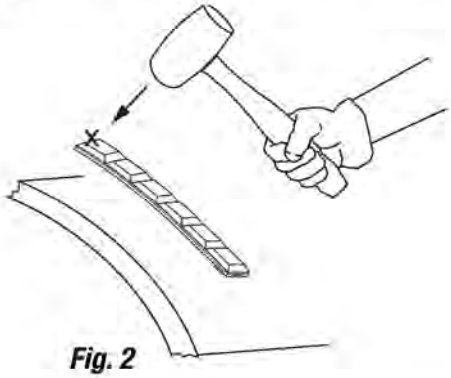

Fig. 2

2b **FOR INSIDE CURVES:** Tack weld one end of "chocky" bar (per welding procedures) in at least 3 places using at least **15mm** of weld in each deposit **(Fig.3a)**. Starting in the center strike bar so that the bar bends and follows the curve **(Fig.3b)**.

3a Stitch weld (per welding procedures) until bar is firmly in place.

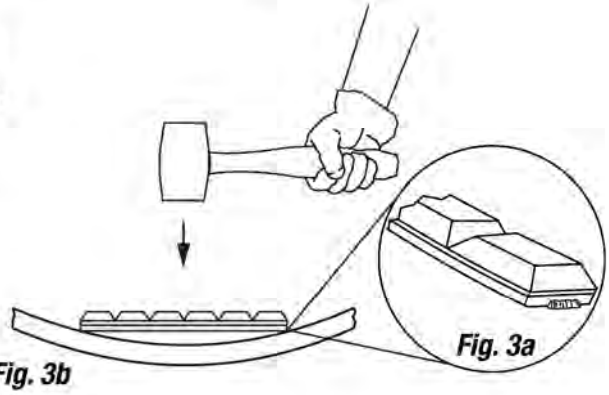

Fig. 3a

Fig. 3b

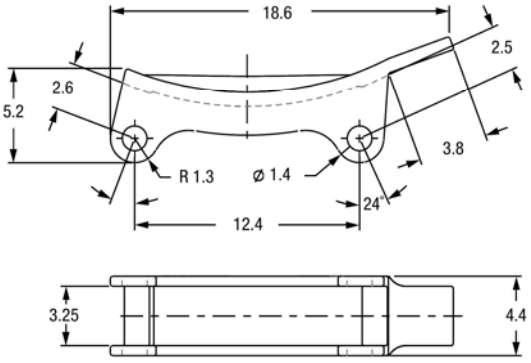
NOTE: White iron may crack during bending. This is normal.

Hensley recommends you always use a soft-face hammer and ANSI-approved (Z87.1) eye protection during cutting and bending procedures.

RIPPER GUARDS
Caterpillar Style

RIPPER GUARDS

Dura
D6J8814
D8, D9
31.4 lb / 14.2 kg



Dura
D9W8365
D10, D11
